

The filing cabinet range
certified for up to two hours
protection against fire

Fire File 31"

FIRE RESISTANT DOCUMENT PROTECTION

Key features

- Certified for 2 hours fire protection of documents according to UL Standard 72, Class 350 Endurance
- Maximised storage capacity that allows users to gain full advantage for their storage requirements. Chubb safes Fire File 31" is available with 2, 3 or 4 drawers
- Each drawer is protected from fire. Even if one of the drawers is accidentally left open, the other closed drawers are still protected by the built in fire resistance partitions
- Easy operable day catch to secure the drawers when closed. Units do not have to be locked to provide fire protection but just be pushed closed
- High-quality steel sliders to ensure comfortable operation and full drawer access
- Lighter weight construction which means smoother transportation and installation
- Interlocking system that prevents more than one drawer being open at once and eliminates risk of tipping
- All models fitted with key lock as standard
- Light grey, powder-coated finish and modern design which blends nicely into any office environment
- Chubb safes Fire File 31" is manufactured in accordance with ISO 9001 for quality management systems and ISO 14001 for environmental management systems

3 drawers

4 drawers

Lock Options

Combination lock

Key lock

Chubbsafes Fire File 31" models are fitted with a single key lock as standard. They can be equipped with a mechanical combination lock for dual locking on request. In addition a key lock can be fitted to each drawer for an independent locking option. All non-standard locking options are available with an extended lead time and at an additional cost.

Finish

Color: Light Grey RAL 7035

Fire Testing

The Chubbsafes Fire File 31" cabinets are tested and certified according to the most common and well-established UL (Underwriter's Laboratories) Standard 72 to Class 350 Fire Endurance for 2 hour duration. The products are subjected to extensive fire testing which simulates the impact of a severe fire. This two-step process includes the following:

Step 1

The filing cabinet is placed in a furnace and heated to a temperature of 1000°C or over. The furnace is switched off after two hours. The unit remains in the furnace until the temperature returns to ambient levels. The content is then examined for signs of damage. Both during furnace heating and the subsequent cooling period, the recorded internal temperature must not have exceeded 177°C (or 350°F).

Step 2

Fire explosion or Shock test. To simulate sudden heating, possibly as a result of rapid fire spread, the cabinet is inserted into a preheated furnace. The stresses and strains such rapid heating creates can easily cause a poorly constructed unit to fail. At all times internal temperatures are not allowed to exceed those set for the Step 1 fire endurance test.
